What is claimed is:

- A load conveyance device, comprising:
- a load supporting device having a through hole passing in a gravity direction; and
- a fluid supplying device to supply a fluid into the through hole;

wherein when a load is dropped into the through hole from a top of the through hole, the load is supported under a floating condition by a force of the fluid in the through hole, and when the load is not supported by change of the force of the fluid, the load drops from a lower end of the through hole to an outside.

- 2. The conveyance device of claim 1, wherein a top section of the through hole has a tapered wall section whose inside diameter increases toward a top open end.
- 3. The conveyance device of claim 2, wherein a taper angle of the tapered wall section is greater than 0 degree and less than 90 degrees.

- 4. The conveyance device of claim 2,wherein a height of the tapered wall section is greater than0.2 times and less than 2.0 times the height of the load.
- 5. The conveyance device of claim 2, wherein a tapered end section having the taper angle greater than that of the tapered wall section, is formed on a top open end of the tapered wall section.
- 6. The conveyance device of claim 1, wherein the fluid supplying device supplies the fluid through an inner circumferential plane of the through hole.
- 7. The conveyance device of claim 6, wherein a porous material is provided at least at a part of the inner circumferential plane of the through hole.
- 8. The conveyance device of claim 7, wherein a porosity ratio of the porous material is 1% or more and 30% or less.
- 9. The conveyance device of claim 7, wherein the porous material is graphite.

- 10. The conveyance device of claim 1, further comprising:

  a shutter member which is positioned lower than the

  fluid supplying device and movable between a position for

  closing at least a part of the through hole and a position

  for opening the through hole.
- 11. The conveyance device of claim 1, wherein pressure and/or amount of the fluid to be supplied are changeable.
- 12. The conveyance device of claim 1, further comprising:

  a heating device for raising a temperature of the fluid
  to be higher than a room temperature.
- 13. The conveyance device of claim 1, wherein the load is conveyed in a heated and fused condition.
- 14. The conveyance device of claim 1, wherein a deviation from spherical form of the load is half or less than average radius R of the load.
- 15. The conveyance device of claim 1,

wherein the load is glass.

- 16. The conveyance device of claim 1, wherein the load is plastic.
- 17. The conveyance device of claim 1, wherein the fluid is a gas of a nitrogen concentration at 60 mol% or more.
- 18. A load conveyance system comprising:
  - a plurality of conveyance devices, comprising
- a load supporting device having a through hole passing in a gravity direction; and
- a fluid supplying device to supply a fluid into the through hole;

wherein when a load is dropped into the through hole from a top of the through hole, the load is supported under a floating condition by a force of the fluid in the through hole, and when the load is not supported by change of the force of the fluid, the load drops from a lower end of the through hole to a outside.

19. The conveyance system of claim 18, wherein

a plurality of the conveyance devices are arranged so that each through hole of the conveyance devices aligns in series.

- 20. The conveyance system of claim 19, further comprising:

  heating devices in each conveyance device which raise
  temperature of the load thrown in the through hole, until
  the load breaks away from each through hole.
- 21. The conveyance system of claim 18, wherein a plurality of the conveyance devices are arranged so that each through hole of the conveyance devices aligns in parallel.
- 22. The conveyance system of claim 18, wherein type of the fluids supplied from the fluid supplying devices of each conveyance device is variable.
- 23. A conveyance method comprising:

a step of dropping a load from a top end of a through hole which is passing through a load supporting device in a gravity direction,

a step of supporting the load denying gravity, by supplying a fluid into the through hole, and

a step of stopping a support of the load by changing a flowing condition of the fluid, and allowing the load to break away from a bottom end of the through hole.

- 24. The conveyance method of claim 23, wherein the flowing condition of the fluid is varied by changing pressure and/or amount of the fluid.
- 25. The conveyance method of claim 23, wherein the flowing condition of the fluid is varied by closing at least a part of the through hole.
- 26. The conveyance method of claim 23, further comprising: a step of heating the fluid.
- 27. The conveyance method of claim 23, wherein the load is conveyed while the load is heated and fused.
- 28. The conveyance method of claim 23, wherein a deviation from spherical form of the load is half or less than average radius R of the load.

- 29. The conveyance method of claim 23, wherein the load is glass.
- 30. The conveyance method of claim 23, wherein the load is plastic.
- 31. The conveyance method of claim 23, wherein the fluid is a gas of a nitrogen concentration at 60 mol% or more.
